A recent investigation by scientists at the U.S. Geological Survey shows that strange animal behavior might help predict future earthquakes. Investigators found such occurrences in a ten-kilometer radius of the epicenter of a fairly recent quake. Some birds screeched and flew about wildly; dogs yelped and ran around uncontrollably. Scientists believe that animals can perceive these environmental changes as early as several days before the mishap. In 1976 after observing animal behavior, the Chinese were able to predict a devastating quake. Although hundreds of thousands of people were killed, the government was able to evacuate millions of other people, thus keeping the death toll at a lower level.

1. What prediction may be made by observing animal behavior?
   A) An impending earthquake.
   B) The number of people who will die.
   C) The ten-kilometer radius of the epicenter.
   D) Environmental changes.

2. Why can animals perceive these changes when humans cannot?
   A) Animals are smarter than humans.
   B) Animals have certain senses that humans don't possess.
   C) By running around the house, they can feel the vibrations.
   D) Humans don't know where to look.

3. Which of the following is not true?
   A) Some animals may be able to sense an approaching earthquake.
   B) By observing animal behavior scientists perhaps can predict earthquakes.
   C) All birds and dogs in a ten-kilometer radius of the epicenter went wild before the quake.
   D) The Chinese have successfully predicted an earthquake and saved many lives.

4. If scientists can accurately predict earthquakes, there will be _____.
   A) fewer animals going crazy
   B) fewer environmental changes
   C) fewer people evacuated
   D) a lower death rate

5. Mishap in “as early as several days before the mishap” means
   A) good fortune
   B) happy time
   C) an unlucky accident
   D) report
